In this publication, all data refer to the current territorial division (current districts) that has been in force since 1 January 2010.

In the presented tables the code stated behind the name of the district is by the classification CZ-LAU1 and the code stated behind the name of the region is by the classification CZ-NUTS3.

All data refer to the resident population of the district, irrespective of citizenship. Since 2001, the figures also include (in accordance with the Population and Housing Census 2001) foreigners with long-term stay (i.e. the stay based on visa over 90 days, as stipulated by Act No. 326/1999 Coll.) and foreigners with granted asylum status (in compliance with Act No. 325/1999 Coll.). Since 1 May 2004, in accordance with amendment No. 326/1999 Coll., the figures include citizens of the European Union with temporary stay on the territory of the Czech Republic, and citizens of other countries with long-term stay. The data also contain information on events (marriages, births and deaths) of permanent residents of CR that occurred abroad.

The population as of 31 December of given year is equal the population as of 1 January of the next year. And, the population as of 31 December of given year is computed as the population as of 1 January of given year plus total population increase. It is not true for years in which the population census was held, when the stock as of 31 December of the year before census is not equal the stock as of 1 January of census year. Here it refers to the Population and Housing Census 2001 - the population as of 1 January 2001 differs from the population as of 31 December 2000.

The disagreement between the population as of 31 December and 1 January by the districts could be also due to the shifts of municipalities between the districts as well as to the extraordinary adjustments of the municipality population stocks.

The adjustments of the municipality population stocks:

As of 1 January 2000 one person from the district Písek to the district České Budějovice and one person from the district Svitavy to the district Ústí nad Orlicí.

Unless otherwise stated, the 'age' refers to completed age in years. The dependency ratio is the number of persons aged 65 and over per 100 persons aged 0-14.

Except 'Marriages by permanent residency of bride' all marriages are regionally classified by permanent residency of groom. Divorces are regionally classified by last common permanent residency of spouses, births are regionally classified by permanent residency of mother, abortions are regionally classified by permanent residency of woman and deaths are regionally classified by permanent residency of deceased.

Total fertility rate (the sum of fertility rates by age) is the average number of children that would be born alive to a woman with presumption that age-specific fertility rates of a given year remain unchanged during her childbearing period (age 15-49).

Premarital conceptions state the first marital childbirths within 7 months after marriage, or their share among all first marital births (in %).

There are not stated deliveries of quadruplets in tables. The delivery of quadruplets was recorded in 2000 in the district Frýdek-Místek, in 2001 in the districts Benešov and Znojmo, in 2002 in the district Vsetín and in 2003 in the district Jihlava.

The abortion data are prepared from a set of individual data taken over by the CZSO from the Institute of Health Information and Statistics of the CR, including its nomenclature of the marital status of women (status 'cohabiting' is used as well). Total abortion rate (the sum of abortion rates by age) is the average number of abortions per woman assuming that age-specific abortion rates of a given year remain unchanged during her childbearing period (age 15-49).

The mid-population of the municipalities (as of 1 July) by age unit has been not available from 2001 so it is impossible to adjust the mid-population of the district according to the shifts of the municipalities between districts. For that reason the total fertility rate and the total abortion rate were calculated from the number of live births and abortions by the birth-year of a woman and from the average women population by the birth-year.

Infant mortality rate is the number of deaths under 1 year of age per 1,000 live births. Neonatal mortality rate is the number of deaths under 28 days of age per 1,000 live births.

Deaths by the primary cause of death are classified according 10th decennial revision of the International Statistical Classification of Diseases and Related Health Problems (ICD-10).

Migration statistics include changes in the place of permanent residence from municipality to municipality in the Czech Republic or abroad (external migration). The total number (internal plus external migration) is published here. The statistics measures the number of moves, not the number of migrants – one person could possibly move twice or more times. The term 'immigrant' is used for immigrant into a district, the term 'emigrant' for emigrant out of a district, in both cases refer to movement across the district line (so as including international migration). The intra-district migration refers to the migration between municipalities within one district (i.e. not cross district line).

Natural increase is the difference between the number of live births and deaths, net migration is the difference between the number of immigrants and emigrants. Total increase is the sum of natural increase and net migration.

Symbols used in tables:

- *The symbol of dash in place of a figure indicates that the phenomenon did not occur.*
- . *The symbol of dot shows that the figure is not available or cannot be relied on.*
- x *The symbol of small cross shows that the figure is not applicable.*
- 0 *The symbol of zero in a table designates figures smaller than half of the unit of measure chosen.*
